Determining Quantifiable Dimensions for Actively Monitoring of
The Development on Social Intelligence
in Measuring Effectiveness of Public Policies

Ground Settings of

The Social Intelligence

For understanding the Basic of **Social Reasoning** on forming various types of behaviour that are emerging as Social Actions in the societies, or at the social channels, we should priorly understand the basic definition of what is;

- Intelligences,
- Adversity
- Activity
- Behaviours
- Attitudes
- Critiques
- Awareness
- Public Interest

For ease your comprehensions about the Structurized reasoning, kindly visit this link; understanding reasoning schematas.pdf

Figurative Intelligence

What then being the basic of determinations, of decision making, of social stances, of certain cognitive tendencies, or the acts of following certain cognitive polars directive abilities to influence public cognitive stances?

Figurative Intelligence involves the function of;

1. Perception,

2. Mental Imitation (the ability to capture and represent the sharpness of the details of the shape/sound of an object),

3. Mental Imagery,

4. Visual Imagery,

5. Language Interpretation (Linguistic Ability).

We become intelligent because our active thinking ability (operative intelligence) sends the meaning obtained into our figurative thinking process. Intelligence is a combination of abilities, skills and habits (abilities, skills & habits) which are formed as a result of the transformation of the assimilation of perceptions that always occur actively in our daily lives.

Jean Piaget, The Late French Cognitive Constructivist, stated that intelligence is active and dynamic, and is a representation of the processing of thought that occurs figuratively, so that understanding can be formed.

Every time, operative intelligence frames our understanding (framework of knowledge) about the world. Our intelligence will change when we cannot understand the transformation that occurs. Piaget stated that this process of understanding and change involves two functions, namely the assimilation function and the accommodation function.

Structurizing Schemata

How to detecting certain Cognitive Schema (or schemata) that are spreading and actively uses by majority of the population within certain environments;

- Understanding Socially Shared Cognitive Structure at certain areas; by studying the pattern of thought or action that are disseminated at the Social Channels.

We can gain the comprehension about The Cognitive Structure of the societies by viewing certain information that are always actively shared by the societies. The type of data that can be massively found are scattered all over the social channels, that have their own sub-stages of social behaviour patterns, social cognitive thought, and directives of social actions.

With this understanding that there are certain schemata of the commonly public cognizant, we can acknowledge certain useful cognitive imagery. By doing **cognitive mind mapping from the data that are actively communicated at certain areas**.

These Comprehensive Data that we gain, can be re-evaluated, re-analysed to enhance the effectiveness of certain marketing strategies, government public policies targeting, and other types of data dissemination that are useful to increase the nations GDP through various economic functions in the societies.

Understanding Antecedents

Certain modes of antecedents or behaviour tendencies are priorly forming before the cognitive bases are then developed into certain behaviour schemes, and forming symbolic actions towards certain objectives, and being operationally spread and disseminated as socially shared cognitive schemata.

The necessary steps that can be taken to engineered certain phases of social behaviour absorbance that has been largely inclined or has shown certain social increments, then can be done by doing re-educative strategies by using the means of Information funnelling at the chosen type of Social Channels.

Everyone are moving towards reaching social cognitive equilibrium. The stage of equilibrium are reached when someone found certain types of cognitive alignment towards their choices of cognitive polars.

When the people found that they have experience certain alignment are formed through various social channels, then we can get the data imagery.
The gathered information data can illustrate the scatters diagrams of social ideas map of marketing trends, shifts of social interests, development towards certain inclinations or increments, etc. We can also called the states of Cognitive Equilibrium as the stances of alignment of reasoning.

Founding The Social Cognitive Directive Inclinations Variables

The engineering of The Social Intelligence is obtained from detecting, monitoring, then determining the status of social increments by actively sensing the directive inclinations variables from the analysis of the formations of Directive Cognitive Perception that are defined by;

1. The repetitions of behaviors
2. Perception Measurement; the results of measuring the point of view
3. Subjective Allocation Formation; changes in subject placement
4. Perceived Similarity; Perception of the similarity of something
5. Subject Proximity; distance between subjects (range)
6. Perspective Taking Ability; the ability to choose a point of view

Phases of Schematic Alignment

Through the actively uses of our social channels, we can also probably found that there are;

1. Behavioral Scheme (sensorimotor)

Before the formation of certain behaviour schemes, we can first sensing certain types of Cognitive Equilibrium Stances that has been massively acknowledged in certain areas.

How the Cognitive Equilibrium are priorly forming?

- Intelligence is a fundamental life force or drive that helps a person adapt to the environment. We can comprehend this type of cognitive entwined by seeing the interactive responses that are happening.
- The type of equilibrium towards the formation of cognitive structures. We also has the ability to sense there are certain tendencies that are forming by seeing whether the responses are done passively or actively.
- Forming Cognitive Acceptance; Produce a balanced relationship between the thought process and the environment where the thoughts are produced;
- Other then doing the regular type of social research, we can also understand the types of cognitive currents that are active at the areas of marketing or social policies targets, by creating fun and adaptive baits that can build the necessary formations of cognitive acceptance.
- Seeing how people are passively responded to positive messages can shows strong currents of negative inclinations. Thus the same also works paradoxically.

- By doing several phases of testing the water before applying certain economic, marketing packages, social policies or political strategy can priorly done before.

Directive Increments Variables

When someone or group of persons are simultaneously found the alignment after reaching certain cognitive equilibrium states, then what will happened next?

When certain cognitive polar has their stances at the societies, they can directively settings the social cognitive formations thus then forming certain increments or inclinations that can increase the possibility of cognitive dis-embarkment towards the government, authority figures, or certain other social power that suppose to keep the world at peace.

How they do this?

- Children are seen as individuals who actively build (construct) thoughts on their surrounding environment (children as constructivists). If children can do active constructions of social cognitive, we can understand that the possibility of mature adult creating these cognitive functions to largely disseminate directly sets inclined information towards creating certain perceptions.

Measuring Social Cognitive Directive Inclination

How The Meta Cognitive Social Master Mind are Disseminating False Absorbance of Perspective Taking of Common Informations In The Objectives of Directing Certain Social Cognitive Inclinations and Creating The Increasing Social Cognitive Increments?

- By redefining the certain regular behavioural pattern that commonly used, into creating some kind of negative perceptions of something that aren't existed.
- By creating desensitizations of morale terms and the avoidance of following priorly setting of definitions of morale premises.
- They are doing this by the productively mastering of news, entertainment, into certain social cognitive inclinations formations. By using the tools of propaganda through news and informations.
- They also doing the disseminations of negative behaviour formations through falsely redefining many sets of rules in the field of religious and divinity belief.
- Forcing people to submit themselves towards their sets of conforming of largely false dogmatic beliefs.
- Making people unaware and unsensitive of the severity of false moral belief, of the severe violations of laws, and
- making people forgot about their own basic virtues, and

- making people tendencies inclined in upholding their own principles.
- Making people unconscious that they have done many moral violations in many of the behaviour that they have done.
- Creating the decreasing of social perception sensivity
- Creating certain paradox of realities into something that being unaware anymore.
- Set back the formations of modern upholding of moral cognitive development, far back plunge into the forming of early cognitive primitives.
- Doing the spread of negative cognizant of social incremental reasoning
- By creating many unimportant news as headlines to creates social cognitive vagueness in the society
- Setting back the social cognitive priority from pursuing the fulfilling of basic necessities into chasing unimportant matters
- Creating the inclinations of political objectives from the necessities of opening vast progress in accelerating industrial development into chasing wars and creating regional conflicts towards nations that located in proximal directions.
- Creating false belief in the societies, usually used by children to explain an object they see or to tell their own experiences, without the usage of theoretical foundations lies beneath.
- Creating their own symbolic language and means of communication to interact and commanding and

directing certain kinds of retaliations, intrusions of peace, etc.

- Creating their own code of cognitive operations Thought processing that are applied to directively mastermind scenario on creating certain an event or to a particular object to be happening without doing anything.
- Only by creating certain false and making up of piles of fake verses, fake histories that aren't happened at all,
- Spreading hate towards prominent promising figures by creating piles of fake evidence, from fake witness, fake documents, creates from massive lies and fable stories
- Creating dense scenarios of intended self fulfilling apocalyptic prophecy to create global insanity
- Creating devilish scenario of the revival of certain religious characters that are sets on certain dates or years to drives massive religious communities into doing many forms of immorality to reach the intended date of prophecy to be fulfilled
- This creates massive insanity on the intended societies into forming their own sets of self actions into fulfilling the false prophecies that are based on fake verses and piles of lies
- psychological structures are first formed by the master mind of the apocalyptic prophecies spreading their scenarios in creating massive lies through various religions

- creating false beliefs for the divine people to social cognitively inaware that they are inclined from their own basic divinity
- creating fake verses, fake history, to justify their own severe devilish acts of what supposedly religious people have to do
- creating fake verses, fake history, to directively mastermind the socio cognitive inclinations of the religious people from their basic sacred religious rituals into doing and commit adultery, and many other forms of immorality
- operating their scenarios on the salient cognitive propaganda's and dogmaticly spreading fake news, fake informations to consider the active authorities figures and authorities functions as defective.
- Creating severe perspective taking impairments in the level of social cognitive into making people thinks that it is okay to judge and do decision making without any public trials, to giving punishment to individuals or to group of people with setting up fake stories about their behaviour, about their objectives or about fake events without experiencing or seeing them directly

Elastic Functions

of Social Cognitions

At the many fields of Social Grounds , whereas numerous of simultaneous Social **Actions** are continuously actively interacts and interforming, we can understand that we have many aspects of Social Channels data absorbance that can be structurized based on the defined Active Actions at Public / Physical or Digital/ Dynamics areas.

For seeing our explanations about Social Channels, kindly download this little concept e-book; https://dreamarks.com/ebooks/elements%20of%20social%20channels.pdf

We can view, analyze, evaluates, and re-arrange the roles and the situations at various Social Channels. For their roles at being the ground of coordination of certain cognitive polars. Many people hasn't realize this large influence that are being disseminated through various social channels.

There are several Social Cognitive Callosum Coordination that are priorly scattered before, then find it shapes that are forming at the Social Grounds of Social Channels. Each will be discussed further, but the phase are;

1. Cognitive Entwined
2. Cognitive Conjugations
3. Cognitive Aligning
4. Cognitive Coordination

Cognitive Entwined

Where a person are active or passively showing interest to follows certain cognitive polar that have already has their Social Stances at the Social Channels.

Whether the people are not showing interest at any kind to the cognitive center, but when someone are actively visiting and continuously viewing and following certain directions from the centre polar, the cognitive influences can be seen through several aspects of cognitive that are being shared.

Sometimes we have to evaluates what are the majority of viewers has centralized upon. The innately disseminated intangible messages, we can measure how much cognitive aspects that has been largely perceived by the societies and being conformingly followed by certain age levels of viewers.

Cognitive Conjugations

When a group or a persons or several persons are being pretentively active to follows after showing interest toward certain cognitive polar at the ground of Social Channels.

This can be seen by the starts to show likes, chats, actively participating, and being engaged to the actively shared opinions, assumptions, information, social directions, news, topics or ideas, social stances, and other cognitively shared directive disseminations of perspective that are being deployed by the Cognitive Polar. Whether the centre of the polar are aware of their influence or not.

Cognitive Aligning

When the person or a groups that are actively participating in certain arrays of the Cognitive Polar, are starting to being influenced by the polar centre, like when he or she are starting to deciding upon a sales purchase, or several other aspects, now has able to be measured simultaneously. For the roles of marketing research, this types of measurements are important to reach certain targets of sales. For the roles of public policy research, we can also do many ways of polling, public opinion, quizzes, survey, and even periodical demographic census.

Cognitive Coordination

At various social channels, we can found many places to be actively participating and to actually met with the other members of certain cognitive polar by means of real communications. These types of cognitive shared influences has also being measured by various keywords algorithms detections. Government has been very much aware of the large influences that are being socially coordinated at the places of Social Channels, whether those located at Digital or Physical areas.
